

Cameyo NoVPN

Eliminating VPNs for Remote Work

Give remote workers secure access to Windows and internal web apps

The urgent increase in remote work has led to a situation where millions of people are working from home on their personal devices. In these instances, the use of VPNs simply provides a secure link between people's personal devices – which are not corporate-managed and could be infected with malware – and the corporate network. In addition to this security concern, VPNs have a negative impact on the user experience that reduces productivity. Cameyo NoVPN enables you to provide your people with access to all of the Windows AND web apps they need to be productive while removing the security and user experience concerns of VPNs.

“The surge in remote work due to COVID-19 has driven a significant increase in demand for solutions that provide remote workers secure access to business applications from any device while working from home. The legacy VPN approach creates a choke point for corporate networks and often results in a poor user experience. Cameyo's NoVPN technology enables employees to securely access their apps without a VPN while maintaining the business's security posture.”

Mark Bowker, Senior Analyst, Enterprise Strategy Group

Simple

Setup takes minutes with little to no IT experience necessary and support is always free.

Cost-Effective

Multi-tenant platform leverages cloud savings with a per-user subscription to prevent bill shock.

Secure

Built-in security features include HTTPS, single sign-on, separation of apps from the OS, and more.

No VPNs

Cameyo securely delivers Windows & internal Web apps without the need for VPNs.

Increased Productivity

Keep your people productive with access to all business-critical apps, even over 2G/3G networks.

Cloud Native

A built-for-the-cloud service that runs in any environment – cloud, hybrid cloud, or on-premises.

“VPN infrastructure is currently being overwhelmed and we see Cameyo as an effective way to securely and seamlessly deliver Windows applications to any device without the cost and complexity of VDI. The Cameyo NoVPN capabilities will also enable us to quickly and securely address the requirements of our customers who need to provide remote access to internally-hosted web apps.”

– Justin Noreikis, Account Director for Asia at Atex

Enabling Greater Workforce Flexibility with Cameyo

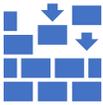

Increase Productivity

- Access to business critical apps from the browser
- Seamless user experience
- Works even on poor home and cellular networks

Reduce Cost & Complexity

- Eliminate the need for costly infrastructure without VPNs
- Reduce management costs and simplify user experience
- 10x cost savings compared to VDI and DaaS

Superior Security

- Non-persistent servers
- Corporate network separated from end use device
- Apps delivered from behind the firewall and over HTTPS

Cameyo Virtual Application Delivery Platform

Cameyo is the most cost-effective and secure way to deliver Windows and internal web applications to any device from the browser.

An offer to get you started:

- Free no-obligation trial
- Cloud usage costs included
- Free support
- Bulk discounts available

Protect Your People and Your Network Without VPNs

Many organizations are using VPNs to give remote workers access to the corporate network. Unfortunately, VPNs are buckling under the increased use and have become a chokepoint. In many cases, they are actually decreasing security when remote workers access the network from a compromised personal device or on an unsecured network. In addition, throughput required when using a VPN is bogging down home networks decreasing remote worker productivity.

Cameyo NoVPN eliminates the need for VPNs. Remote workers securely access business-critical Windows software and internal web apps over HTTPS from servers that are behind the corporate firewall. Minimal throughput is required because Cameyo delivers apps using HTML5 - we even have customers in some parts of the world accessing business critical applications on 2G networks. With Cameyo, your network remains protected while users are safely and productively working from home.

Enabling 500 Remote Workers in 3 Hours

As the COVID-19 pandemic escalated, a large energy company in the UK quickly implemented a mandatory work-from-home policy. They determined that 500 employees throughout the enterprise would no longer have access to their billing and client management software, which was critical for keeping their business moving forward. In just 3 hours Cameyo was able to deploy the service and restore application access for all 500 users at the energy company, and delivered the platform as a fully elastic service in the customer's cloud environment to ensure user spikes do not impact performance.

Why Cameyo?

Cameyo delivers the simplest and fastest way to securely implement remote work by giving organizations of all sizes secure access to all of their business-critical Windows applications on any device from a powerful Digital Workspace. With no infrastructure required, customers can fully deploy Cameyo in hours, not weeks or months like VDI and DaaS.
