UniPrint InfinityCloud for Enterprise Cloud Printing

Modern Cloud Printing for The New Normal

Cloud printing has always been a convenient service, as it works both on desktop and mobile devices, and gives extended utility to older printers.

However, there are still many companies who have not adapted their technology to the rapidly changing times. These businesses are spending too much time and money on facilitating and managing all aspects of printing, while often having little or no insight into their actual costs.

UniPrint InfinityCloud is a cloud printing service that offers a secure cloud printer management platform which adds value through print statistics tracking, centralized remote print management of direct IP printing, and simplified end-user printing, all through the cloud.

The cloud print management platform enables organizations to leverage their common platforms and services, regardless of location or infrastructure, while also removing the need for costly print servers.

Key Benefits

Universal home and office printing experience

Security and compliance

Remote administration of printers, drivers, and users

Fast deployment of print drivers to printers
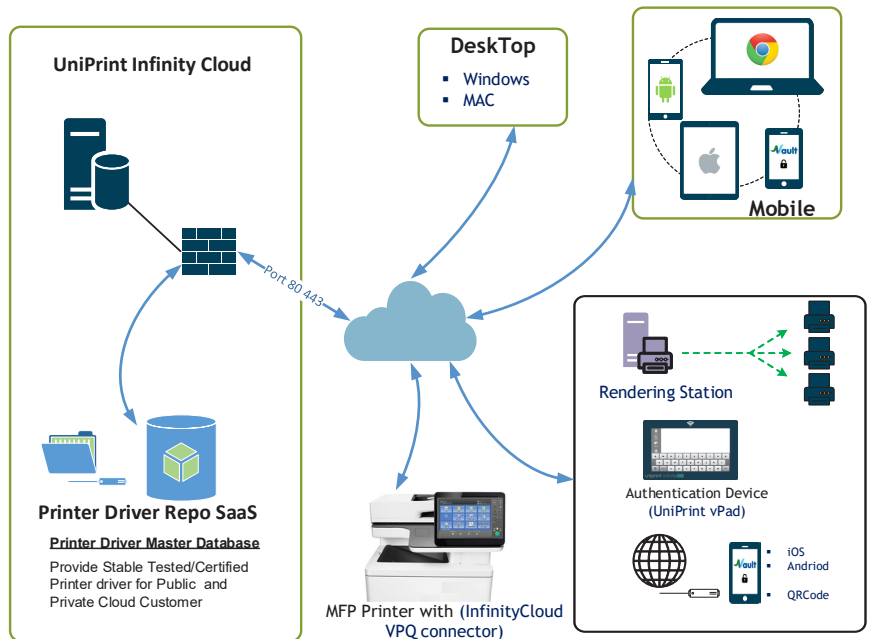

Reduced print-related IT support costs

Removal of costly physical print servers

Process Fusion

How It Works

All printers and their printer data are migrated from your print servers to the Cloud. After a user downloads and installs the UniPrint Cloud agent onto their workstation, it will automatically retrieve all the appropriate printer drivers for their IP printers from the InfinityCloud platform.

The user then simply needs to select PRINT and the print job will be sent directly to the IP printer. Print jobs can also be sent to the Cloud to be released on demand through any mobile device or secure release station.
